

# Embracing a Secure Cloud

## Cloud & Network Virtualisation India 2017

# Cloud Computing

Group of computing resources providing services such as servers, storage, databases, software, applications, networks etc. over the Internet/private network

## Benefits

- Flexibility
- Efficiency

# Cloud Computing Security Incidents

- Dow Jones Data Leak Results (over 1 million users) sue to an AWS Configuration Error (2017)
  - Salesforce Database Failure Wipes Out 5 Hours of Corporate Customer Data (2016)
  - Millions of accounts of LinkedIn users have been extracted and put up for sale in Dark Web (2012)
  - Intuit Cloud Outage Blocks Access to Financial Software for 36 Hours (2010)
- and there are many more.....

# Cloud Computing Security Threats

- Sovereignty and legal boundary
- Data leakage
- Compromised credential and broken authentication
- Hacked interface & APIs
- Vulnerabilities & weaknesses
- Malicious insider
- DOS/DDOS attacks
- Shared technology result in common issues

# Major challenge for Indian telcos

**Sovereignty and  
legal boundary of  
Subscriber's information**

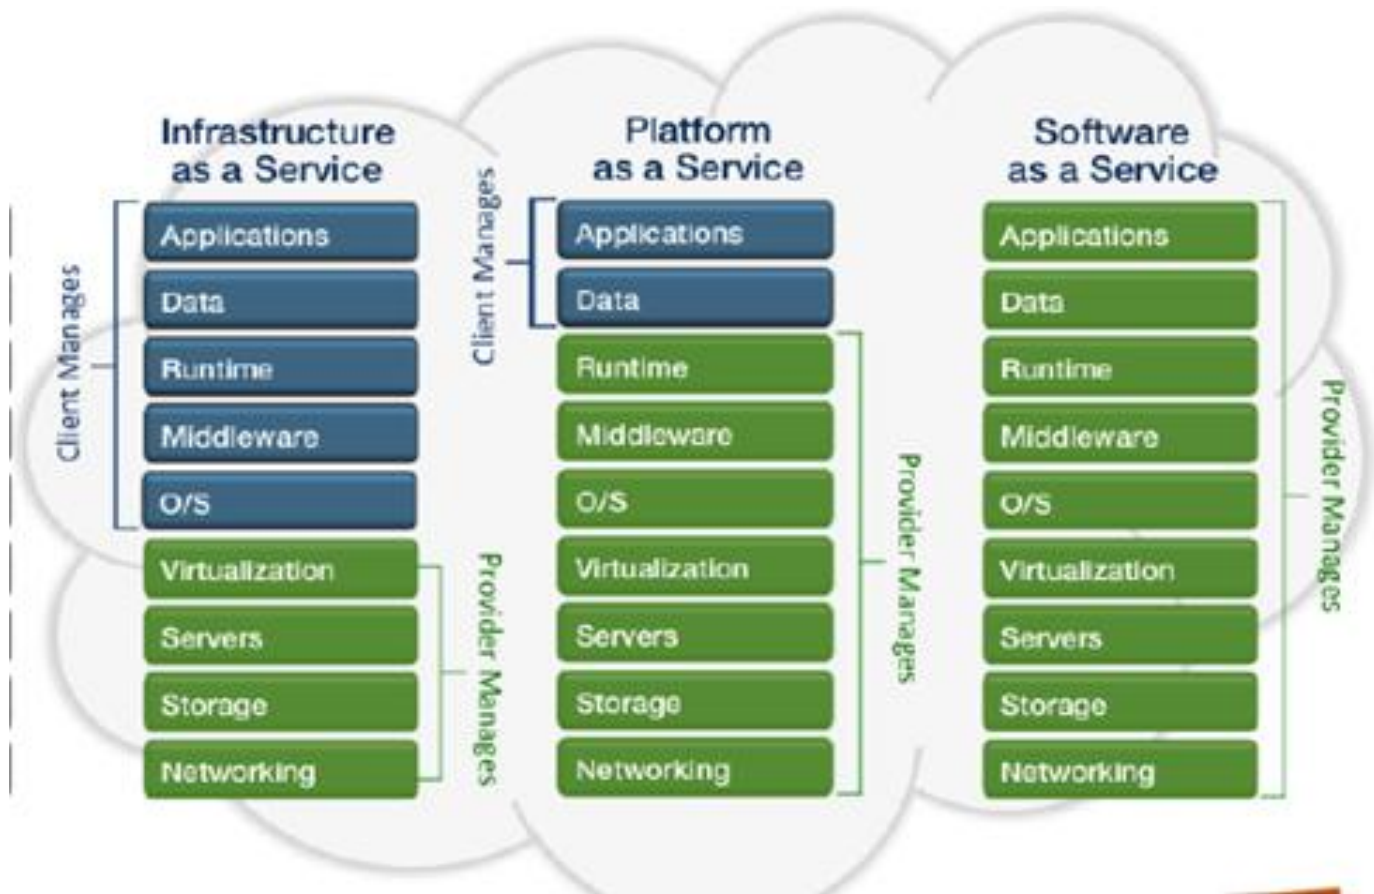

# Types of Cloud Computing

SAAS

PAAS

IAAS

# Way to Implement

## Private Cloud

- On premises virtualization
- Behind corporate firewalls
- Complete control of security
- A physical part of the corporate data center
- Can be hosted at a hosting facility

## Virtual Private Cloud

- Vendor hosted virtualization
- Isolated from the public Internet
- Vendor specific security, including specialized firewalls
- An extension to the corporate data center

## Public Cloud

- Vendor hosted virtualization
- Open to the public Internet
- Per host software firewalls
- Vendor Specific Security Controls
- Not an extension of the corporate Data Center

# Information Security Processes in a Cloud

## Scope of Responsibility

IaaS

Network Layer Security Controls

System Level Security Controls

PaaS

Middleware Security Controls

Platform Specific Controls

SaaS

Application Level Security Controls

User Access Controls

# Cloud Security Processes - SAAS

Security Processes	Vendor	← Shared →	Customer
User Access Process			X
Data Confidentiality		X	
Application Security Config.			X
System Security	X		
Log Collection / Sec. Intelligence		X	
Patch Management	X		
Network Security	X		
Vulnerability Management	X		
Intrusion Detection / Prevention	X		
Incident Response	X		
Advanced Threat Management		X	
Physical Security	X		

▪ **Security technology in consideration**

- Data encryption (In-Transit)
- Security Information and Event Management (SIEM) for application incidents
- Automated user access provisioning / de-provisioning
- Automation of user access reviews
- Role-based access controls
- Separation of duties considerations
- Single-sign on
- Data Loss Prevention
- Security Configurations:
- Transfer of data from DC to the application
- Timeouts
- CASB

# Cloud Security Processes - PAAS

Security Processes	Vendor	← Shared →	Customer
User Access Process			X
Data Confidentiality		X	
Application Security Config.			X
System Security		X	
Log Collection / Sec. Intelligence		X	
Patch Management		X	
Network Security	X		
Vulnerability Management		X	
Intrusion Detection / Prevention	X		
Incident Response		X	
Advanced Threat Management		X	
Physical Security	X		

- In addition to security technology in consideration of SAAS, additional points for PAAS are**
  - Remote access controls
  - API access controls
  - VPN / B2B connectivity
  - Patch Management
  - Vulnerability Management
  - Additional SIEM integrations at the platform level

# Cloud Security Processes - IAAS

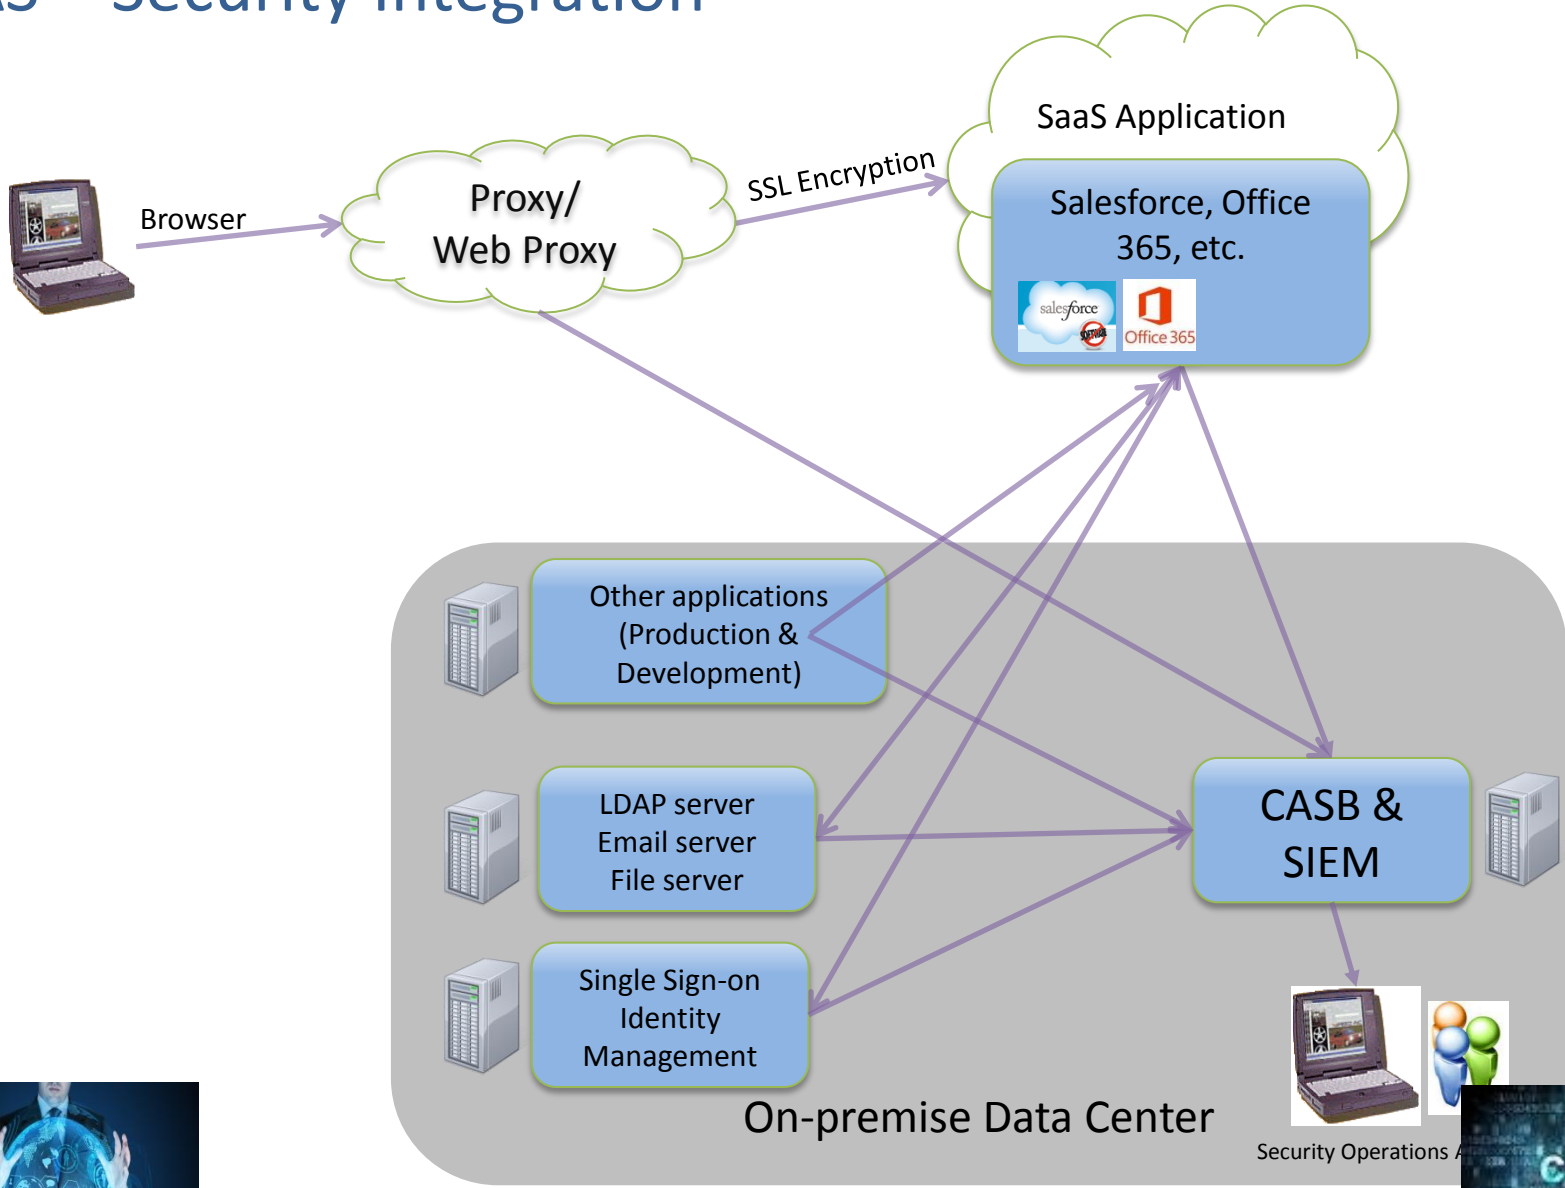

Security Processes	Vendor	← Shared →	Customer
User Access Process			X
Data Confidentiality		X	
Application Security Config.			X
System Security			X
Log Collection / Sec. Intelligence		X	
Patch Management			X
Network Security			X
Vulnerability Management		X	
Intrusion Detection / Prevention		X	
Incident Response		X	
Advanced Threat Management		X	
Physical Security	X		

- In addition to security technology in consideration of SAAS & PAAS, additional points for IAAS are**

- Encryption (at rest)
- Direct network connections
- Network firewalls
- Security groups (per instance firewalls)
- Intrusion protection
- End point malware
- End point data loss prevention
- Additional SIEM integration at the virtual hardware level

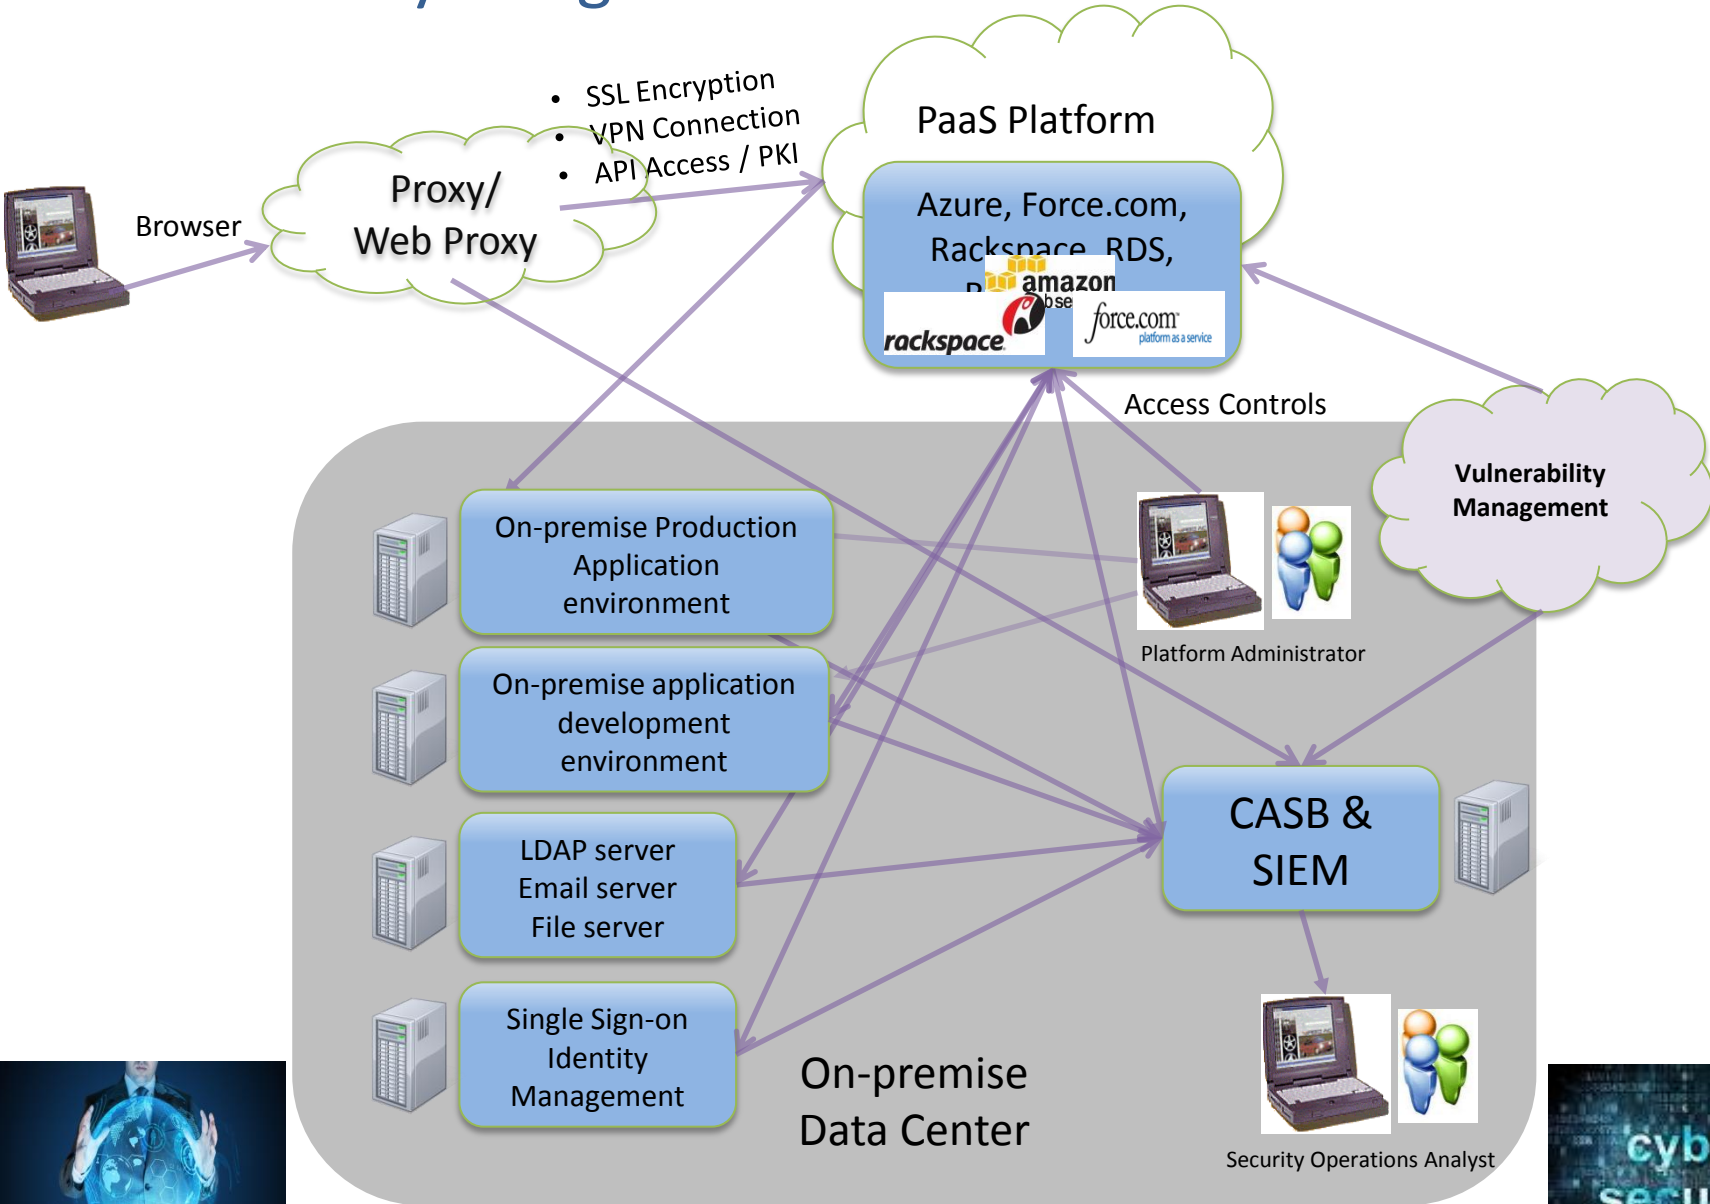

# SAAS – Security Integration
